

OPENSOURCE TEST APPLICATION LIFECYCLE MANAGEMENT

OPENSOURCE TEST ALM

Manage your testing across the entire development lifecycle leveraging Opensource toolsets.

LOWER COST OF OPERATIONS

Reduce your overall cost of operations without compromising on management control across the entire test lifecycle. Faster rollouts and easy transitions from paid COTS to Opensource.

PAY FOR WHAT YOU NEED

Integrate only those toolsets that you need depending on your organization / project complexities. Bolt on as you progress.

Opensource has become mainstream and adoption across all industry segments driving the need for integrated Opensource solutions. Opensource tools have hit high maturity curves – both in types and adoption and cover the entire Application Lifecycle. The tools are great, they do what they are focused to do well, the challenge however is the lack of tightly coupled integration between related toolsets.

That coupled with the management overheads in trying to ensure consistency across, sometimes leads to slowing down in the adoption. So welcome to the Test ALM - that attempts to do what COTS have so far provided at prohibitive prices for fledgling customers. We provide a solution that can be hosted or installed - your choice of how you need to deploy.

- One set of Opensource tools that can manage the entire test requirements through to execution phases
- Integrate seamlessly with upstream and downstream components making the entire user experience uniform.
- Backward and forward traceability maintained and managed
- Ability to plug in different Opensource components
- Ability to migrate from COTS to Opensource with minimal touch

TestALM – allows you to manage Agile user stories, link it to tests, link tests to automated scripts, and link execution data to defects. An analytics engine gives you powerful, customizable analytics that allow you to drill down test results along different dimensions. The Opensource based TestALM is designed – not to tamper with the functionalities offered by existing Opensource tools, but to enhance it to make it interoperable. With both upstream and downstream integration, you are now able to provide traceability right from your user stories up until the defect. So go forth, build user stories and tests, automate them, log defects and most importantly MANAGE them.

The Test ALM Components

ON SITE INSTALL

The entire solution is available for onsite installation, including source code. You are free to enhance it, should you so desire.

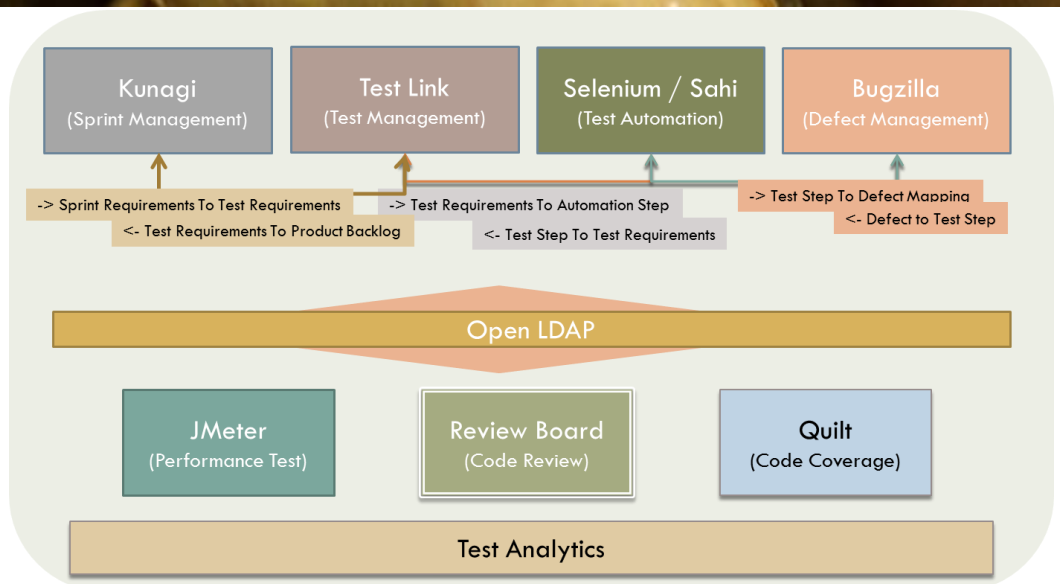

HOSTED SOLUTION

Hosted on a specific cloud server, as your instance, sized based on your need. We do not share instances, so that you can be guaranteed of complete security.

TURNKEY SOLUTIONS

Define the workflow with your team, deploy the Test ALM solution, customize it to your needs, migrate your existing test assets, team training, support and maintenance.

Key Features

- Single Sign On Feature to ensure seamless carryover of privileges
- Track User stories from requirements, through to tests to defects that impact its progress
- Automate in tools of your choice, link automated test scripts to tests and kick off an automated run and view results on completion
- Track defects across the entire spectrum of assurance activities – from reviews to tests
- Link builds to test suites and track results in real time
- Derive analytics using Opensource BI tools – customized to your needs

SERVICES AVAILABLE

Test ALM Deployment
Installation and Setup
Migration
Workflow Definition

OTHER SERVICES

Process Consulting
Competency Enablement
